

# DATASCI 347 Machine Learning

## Lecture 10: Regularization

Ruoxuan Xiong

Suggested reading: ISL Chapter 6

# Lecture plan

- Comparison between ridge regression and lasso
- Elastic net
- Lab session

# Ridge regression

- Ridge regression minimizes

$$\sum_{i=1}^n \left( Y_i - \beta_0 - \sum_{j=1}^p \beta_j X_{i,j} \right)^2 + \lambda \sum_{j=1}^p \beta_j^2$$

- $X_{i,j}$ :  $j$ -th predictor of  $i$ -th observation
- $\|\beta\|_2^2 = \sum_{j=1}^p \beta_j^2$ :  $\|\beta\|_2$  is called the  $\ell_2$  norm of  $\beta \in \mathbb{R}^p$
- $\beta_0$ : mean of  $Y_i$
- Shrinkage penalty  $\lambda$  does not apply to  $\beta_0$

# Least absolute shrinkage and selection operator (Lasso)

- Lasso minimizes

$$\sum_{i=1}^n \left( Y_i - \beta_0 - \sum_{j=1}^p \beta_j X_{i,j} \right)^2 + \lambda \sum_{j=1}^p |\beta_j|$$

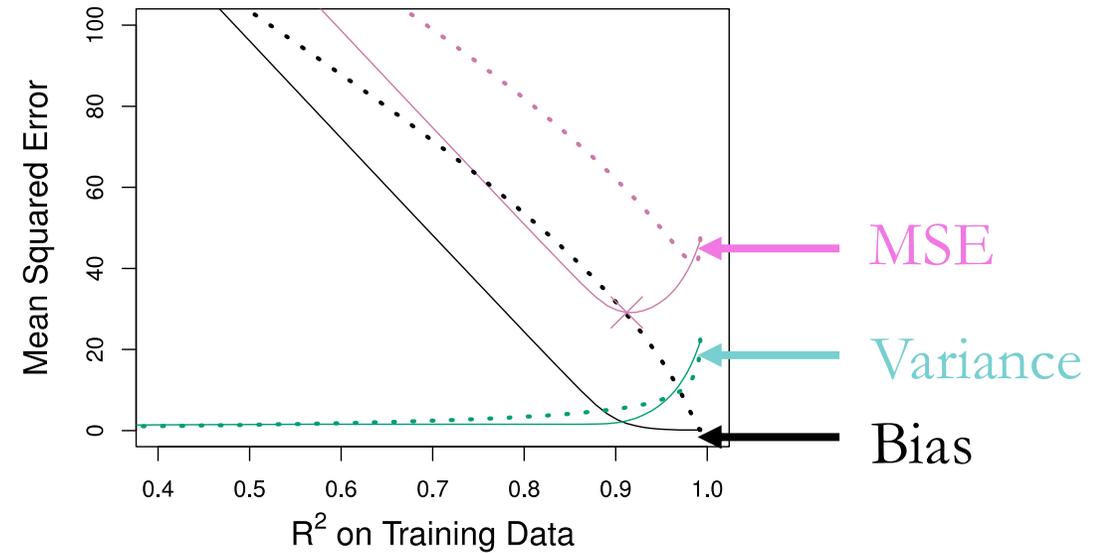

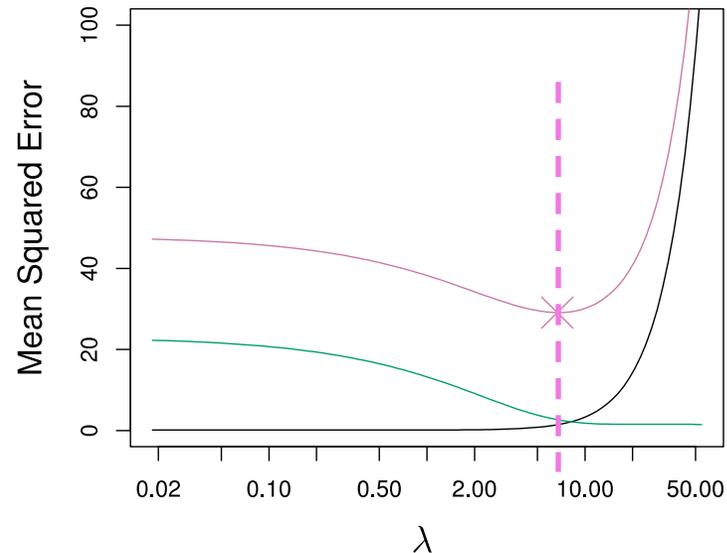

- $X_{i,j}$ :  $j$ -th predictor of  $i$ -th observation
- $\|\beta\|_1 = \sum_{j=1}^p |\beta_j|$ :  $\|\beta\|_1$  is called the  $\ell_1$  norm of  $\beta \in \mathbb{R}^p$
- $\beta_0$ : mean of  $Y_i$
- Shrinkage penalty  $\lambda$  does not apply to  $\beta_0$

# Lasso vs. Ridge regularization

- **Simulation I:** Only 2 coefficients are non-zero
  - Simulated data: 45 predictors, 2 out of  $\beta_1, \dots, \beta_{45}$  are nonzero

Solid lines (—): Lasso  
Dash lines (···): Ridge

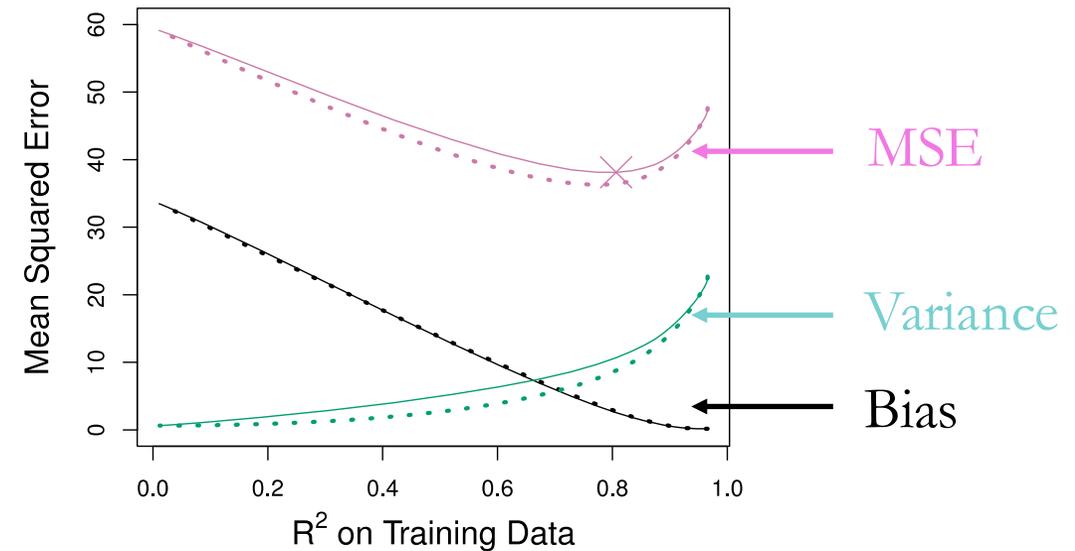

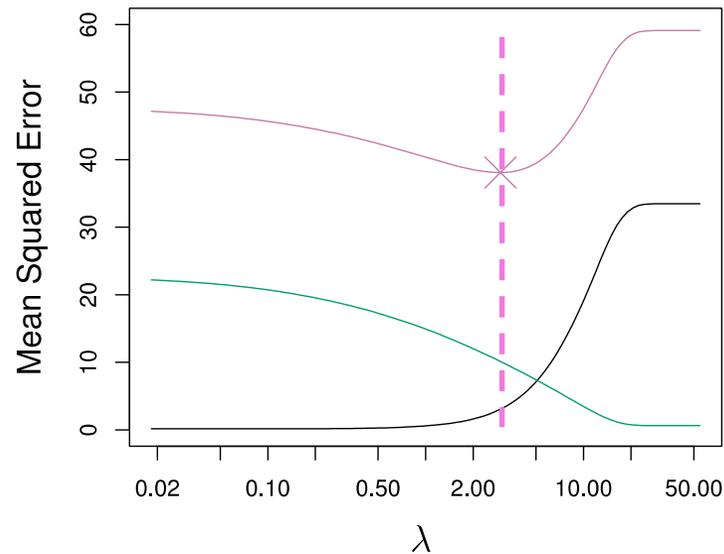

- The **bias**, **variance**, and **MSE** are all lower for the lasso

# Lasso vs. Ridge regularization

- **Simulation II:** Most of the coefficients are non-zero
  - Simulated data: 45 predictors  $\beta_1, \dots, \beta_{45}$  are nonzero

Solid lines (—): Lasso  
Dash lines (···): Ridge

- The **variance** of ridge regression is smaller
- The **bias** is about the same for both
- Hence the **MSE** of ridge regression is smaller

# Lasso vs. Ridge regularization

- **Takeaways:** Neither ridge nor the lasso universally dominates
  - Lasso performs better if **a small number of predictors with large coefficients**
  - Ridge performs better if **many predictors with similar coefficients**
  - Select which one by **cross-validation** 😊

# Lecture plan

- Comparison between ridge regression and lasso
- Elastic net
- Lab session

# Elastic net

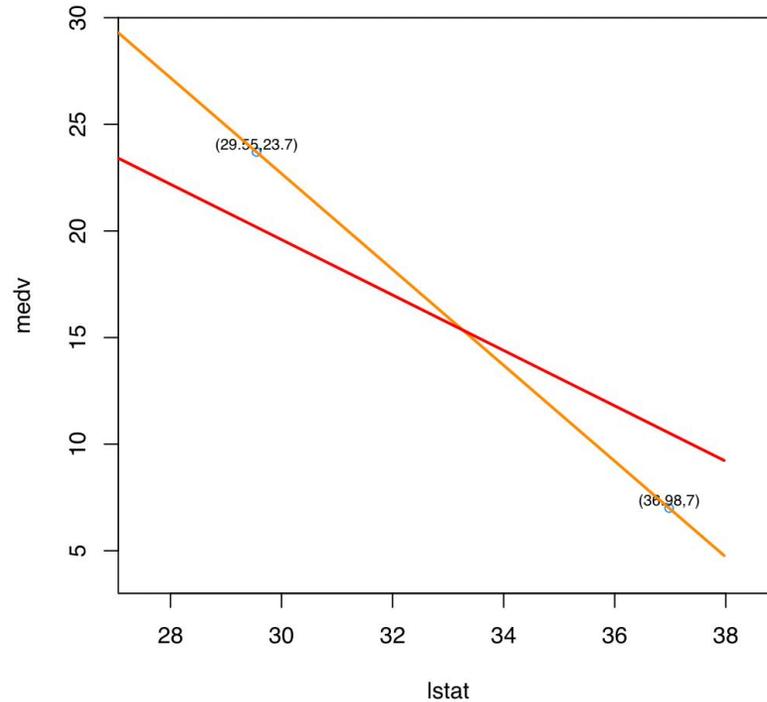

- Elastic net combines lasso and ridge penalty, and minimizes
  - $\sum_{i=1}^n (\text{med}v_i - \beta_0 - \text{lstat}_i \cdot \beta_1)^2 + \lambda \cdot (1 - \alpha) \cdot \frac{\beta_1^2}{2} + \lambda \cdot \alpha \cdot |\beta_1|$
  - $\lambda \geq 0$ : tuning hyper-parameter
  - $\alpha \in [0,1]$ : tuning hyper-parameter
    - $\alpha = 0$ : ridge
    - $\alpha = 1$ : lasso

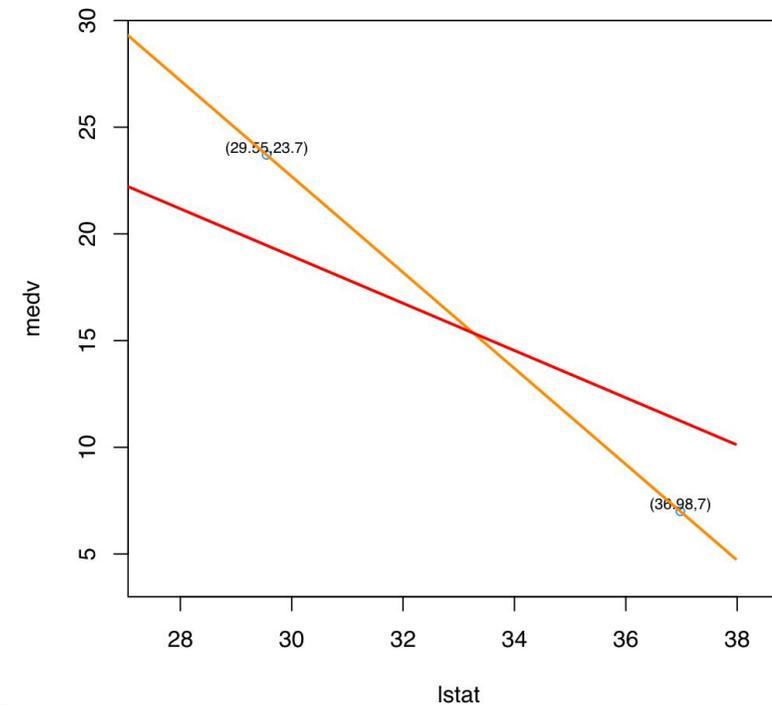

# Role of $\alpha$ and $\lambda$ in elastic net

- Elastic net combines lasso and ridge penalty, and minimizes
  - $\sum_{i=1}^n (\text{medv}_i - \beta_0 - \text{lstat}_i \cdot \beta_1)^2 + \lambda \cdot (1 - \alpha) \cdot \frac{\beta_1^2}{2} + \lambda \cdot \alpha \cdot |\beta_1|$
  - $\alpha = 0.3, \lambda = 5: \hat{\beta}_1^E = -1.299; \alpha = 0.7, \lambda = 5: \hat{\beta}_1^E = -1.107$

alpha = 0.3, lambda = 5

alpha = 0.7, lambda = 5

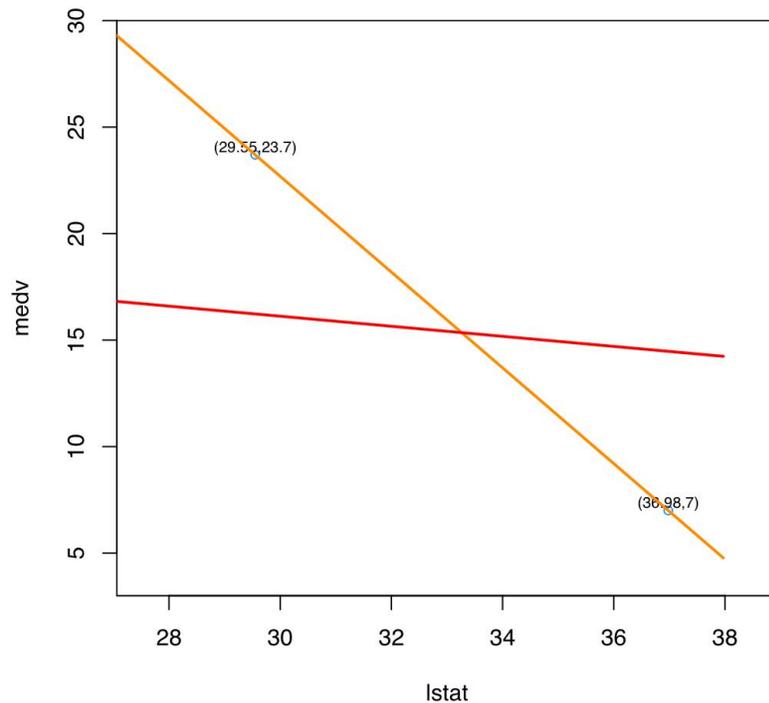

# Role of $\alpha$ and $\lambda$ in elastic net

- Elastic net combines lasso and ridge penalty, and minimizes

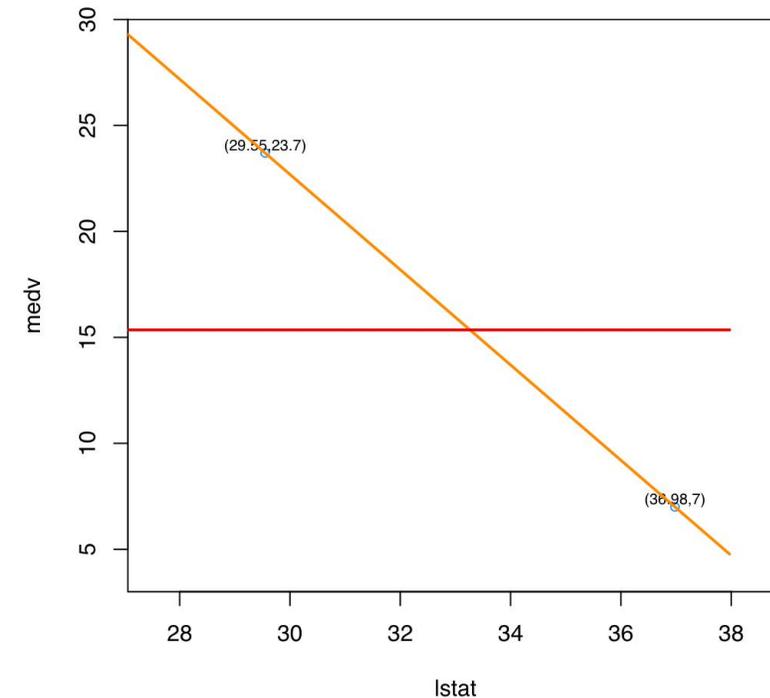

- $\sum_{i=1}^n (\text{medv}_i - \beta_0 - \text{lstat}_i \cdot \beta_1)^2 + \lambda \cdot (1 - \alpha) \cdot \frac{\beta_1^2}{2} + \lambda \cdot \alpha \cdot |\beta_1|$

- $\alpha = 0.3, \lambda = 20: \hat{\beta}_1^E = -0.236; \alpha = 0.7, \lambda = 20: \hat{\beta}_1^E = 0$

alpha = 0.3, lambda = 20

alpha = 0.7, lambda = 20

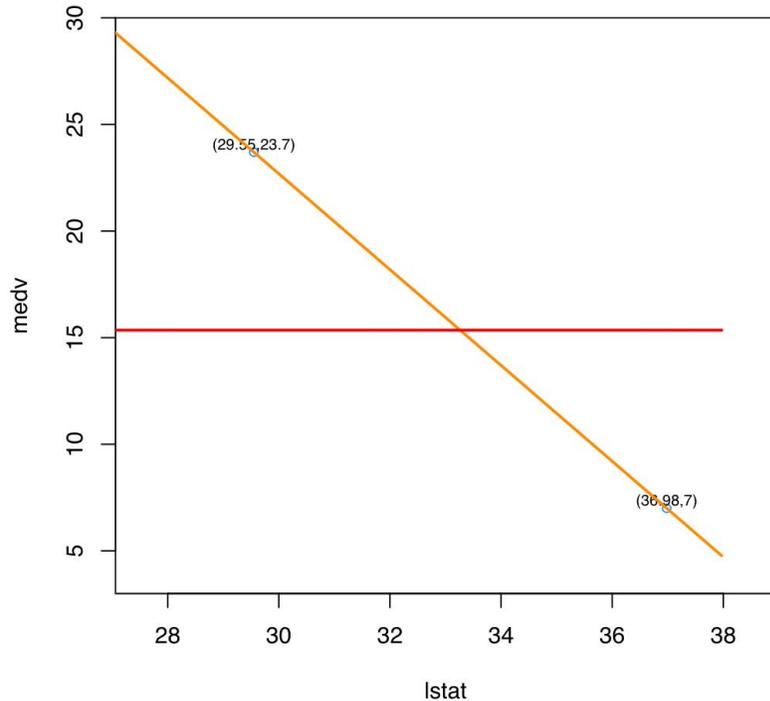

# Role of $\alpha$ and $\lambda$ in elastic net

- Elastic net combines lasso and ridge penalty, and minimizes

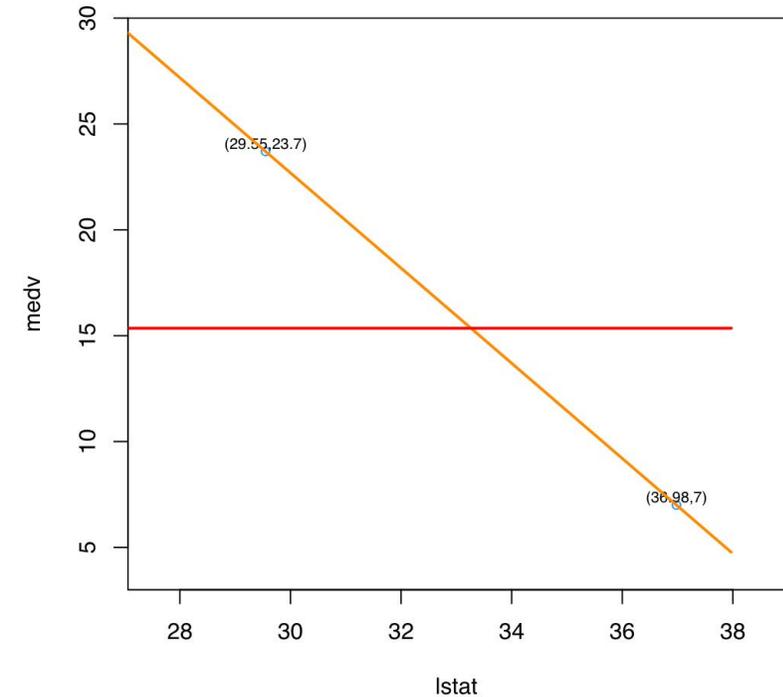

- $\sum_{i=1}^n (\text{medv}_i - \beta_0 - \text{lstat}_i \cdot \beta_1)^2 + \lambda \cdot (1 - \alpha) \cdot \frac{\beta_1^2}{2} + \lambda \cdot \alpha \cdot |\beta_1|$

- $\alpha = 0.3, \lambda = 50: \hat{\beta}_1^E = 0; \alpha = 0.7, \lambda = 50: \hat{\beta}_1^E = 0$

alpha = 0.3, lambda = 50

alpha = 0.7, lambda = 50

# Choose $\alpha$ and $\lambda$ by cross-validation

- The procedure is the **same** for ridge and lasso
  1. Choose a grid of  $\alpha$  values and a grid of  $\lambda$  values
  2. Compute the cross-validation error for each  $(\alpha, \lambda)$  value
  3. Select the  $(\alpha, \lambda)$  with the smallest cross-validation error
  4. Refit the model using all observations and selected  $(\alpha, \lambda)$
